Appl. No. 09/628,186

Amendment dated September 18, 2003

Supplemental Reply to Office Action of October 28, 2003

Attorney Ref. No.: 037003-0280721

Page 2

I. AMENDMENT

IN THE SPECIFICATION:

Please replace the paragraph beginning at page 14, line 3, with the following rewritten

paragraph:

Co-pending applications 09/259,337 and 09/259,347, co-owned and submitted

concurrently herewith, disclose binding assays which may be used to assess the percent

binding affinity and immunoreactivity of conjugates after labeling if desirable. It should be

stressed that, although no further purification is required after the labeling methods of the

present invention, a TLC-based assay to verify the level of radioincorporation should always

be performed so as not to jeopardize the health of the patient. Such an assay can be

performed in about 3-4 minutes, and should not significantly affect the stability or efficacy of

the radiotherapeutic.

IN THE CLAIMS:

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently amended) A method for radiolabeling a chelator-conjugated protein,

ligand or peptide with a therapeutic radioisotope for administration to a patient comprising

(i) mixing the chelator-conjugated protein, ligand or peptide with a solution

comprising the therapeutic radioisotope or salt thereof, and

(ii) incubating the mixture for a sufficient amount of time under amiable

conditions such that a radiolabeled protein, ligand or peptide having sufficient radiochemical

purity greater than 95%, and sufficient binding specificity, and having a specific activity of at

least about 5 mCi/mg, is achieved such that the radiolabeled protein, ligand or peptide may be

administered directly to the patient without further purification.
